

# Who Gets to Race? The Effect of Initial Bias on Pronominal Ambiguity Advantage

Ruoqing Yao, Matthew Wagers • Department of Linguistics, University of California, Santa Cruz

## I. Background: Processing ambiguous pronouns

- ❖ A pronoun can have more than one syntactically available antecedent.
- (1) Brian mentioned to Andy that he would be a great leader of the team.
  - ❖ Grant et al. (2020) showed an **ambiguity advantage effect** for processing ambiguous pronouns.
    - (1) is less costly than its unambiguous counterparts in (2).
- (2) a. Brian mentioned to Mary that he would be a great leader of the team.  
b. Grace mentioned to Andy that he would be a great leader of the team.
  - ❖ They argue that this effect can be explained by the **Unrestricted Race Model (URM)** (van Gompel 2001, 2005).
    - The parse that happens to be constructed faster will be adopted.
      - The outcome is stochastic.
    - If this parse is later found to be problematic, reanalysis is triggered.
      - additional cost for unambiguous sentences
    - But there is no reanalysis with ambiguity.

- ❖ URM, however, predicts the ambiguity advantage effect to be conditioned by **initial bias** between the two possible antecedents.
  - Unambiguous sentences are more costly to the extent the parser will choose the incompatible antecedent about **half of the time**.
  - But, if the two antecedents are NOT 'equal' to begin with,
    - The biased antecedent will be more selected in both ambiguous and unambiguous conditions.
    - Ambiguity advantage is thus predicted to reduce where the biased antecedent is available.
      - Available = match the features of the pronoun

### Prediction

If there is a referent bias for an ambiguous pronoun created by the construction, ambiguity advantage will reduce.

## 2. Design & Methods

- ❖ **Three possible antecedents**
- ❖ **The construction aims to create a matrix-subject bias**
  - Subordinate clause subject + matrix subject + matrix object
  - Subordinate clause: conjunction (when/after/before/as/because) + subject + intransitive verb
  - Main clause: subject + *transfer-of-information* verb + object + embedded clause
- ❖ **Self-paced reading + comprehension question**
  - 54 target items + 54 filler items
  - 49 college-age participants from UC Santa Cruz
  - 7 conditions (2x2x2 - 1 [Mismatch, Mismatch, Mismatch])
  - Pronoun gender and name-to-position assignment were counterbalanced across all itemsets.
  - Names were selected from California Open Data Portal.

## 3. Results

### Ambiguity advantage conditioned by subject response

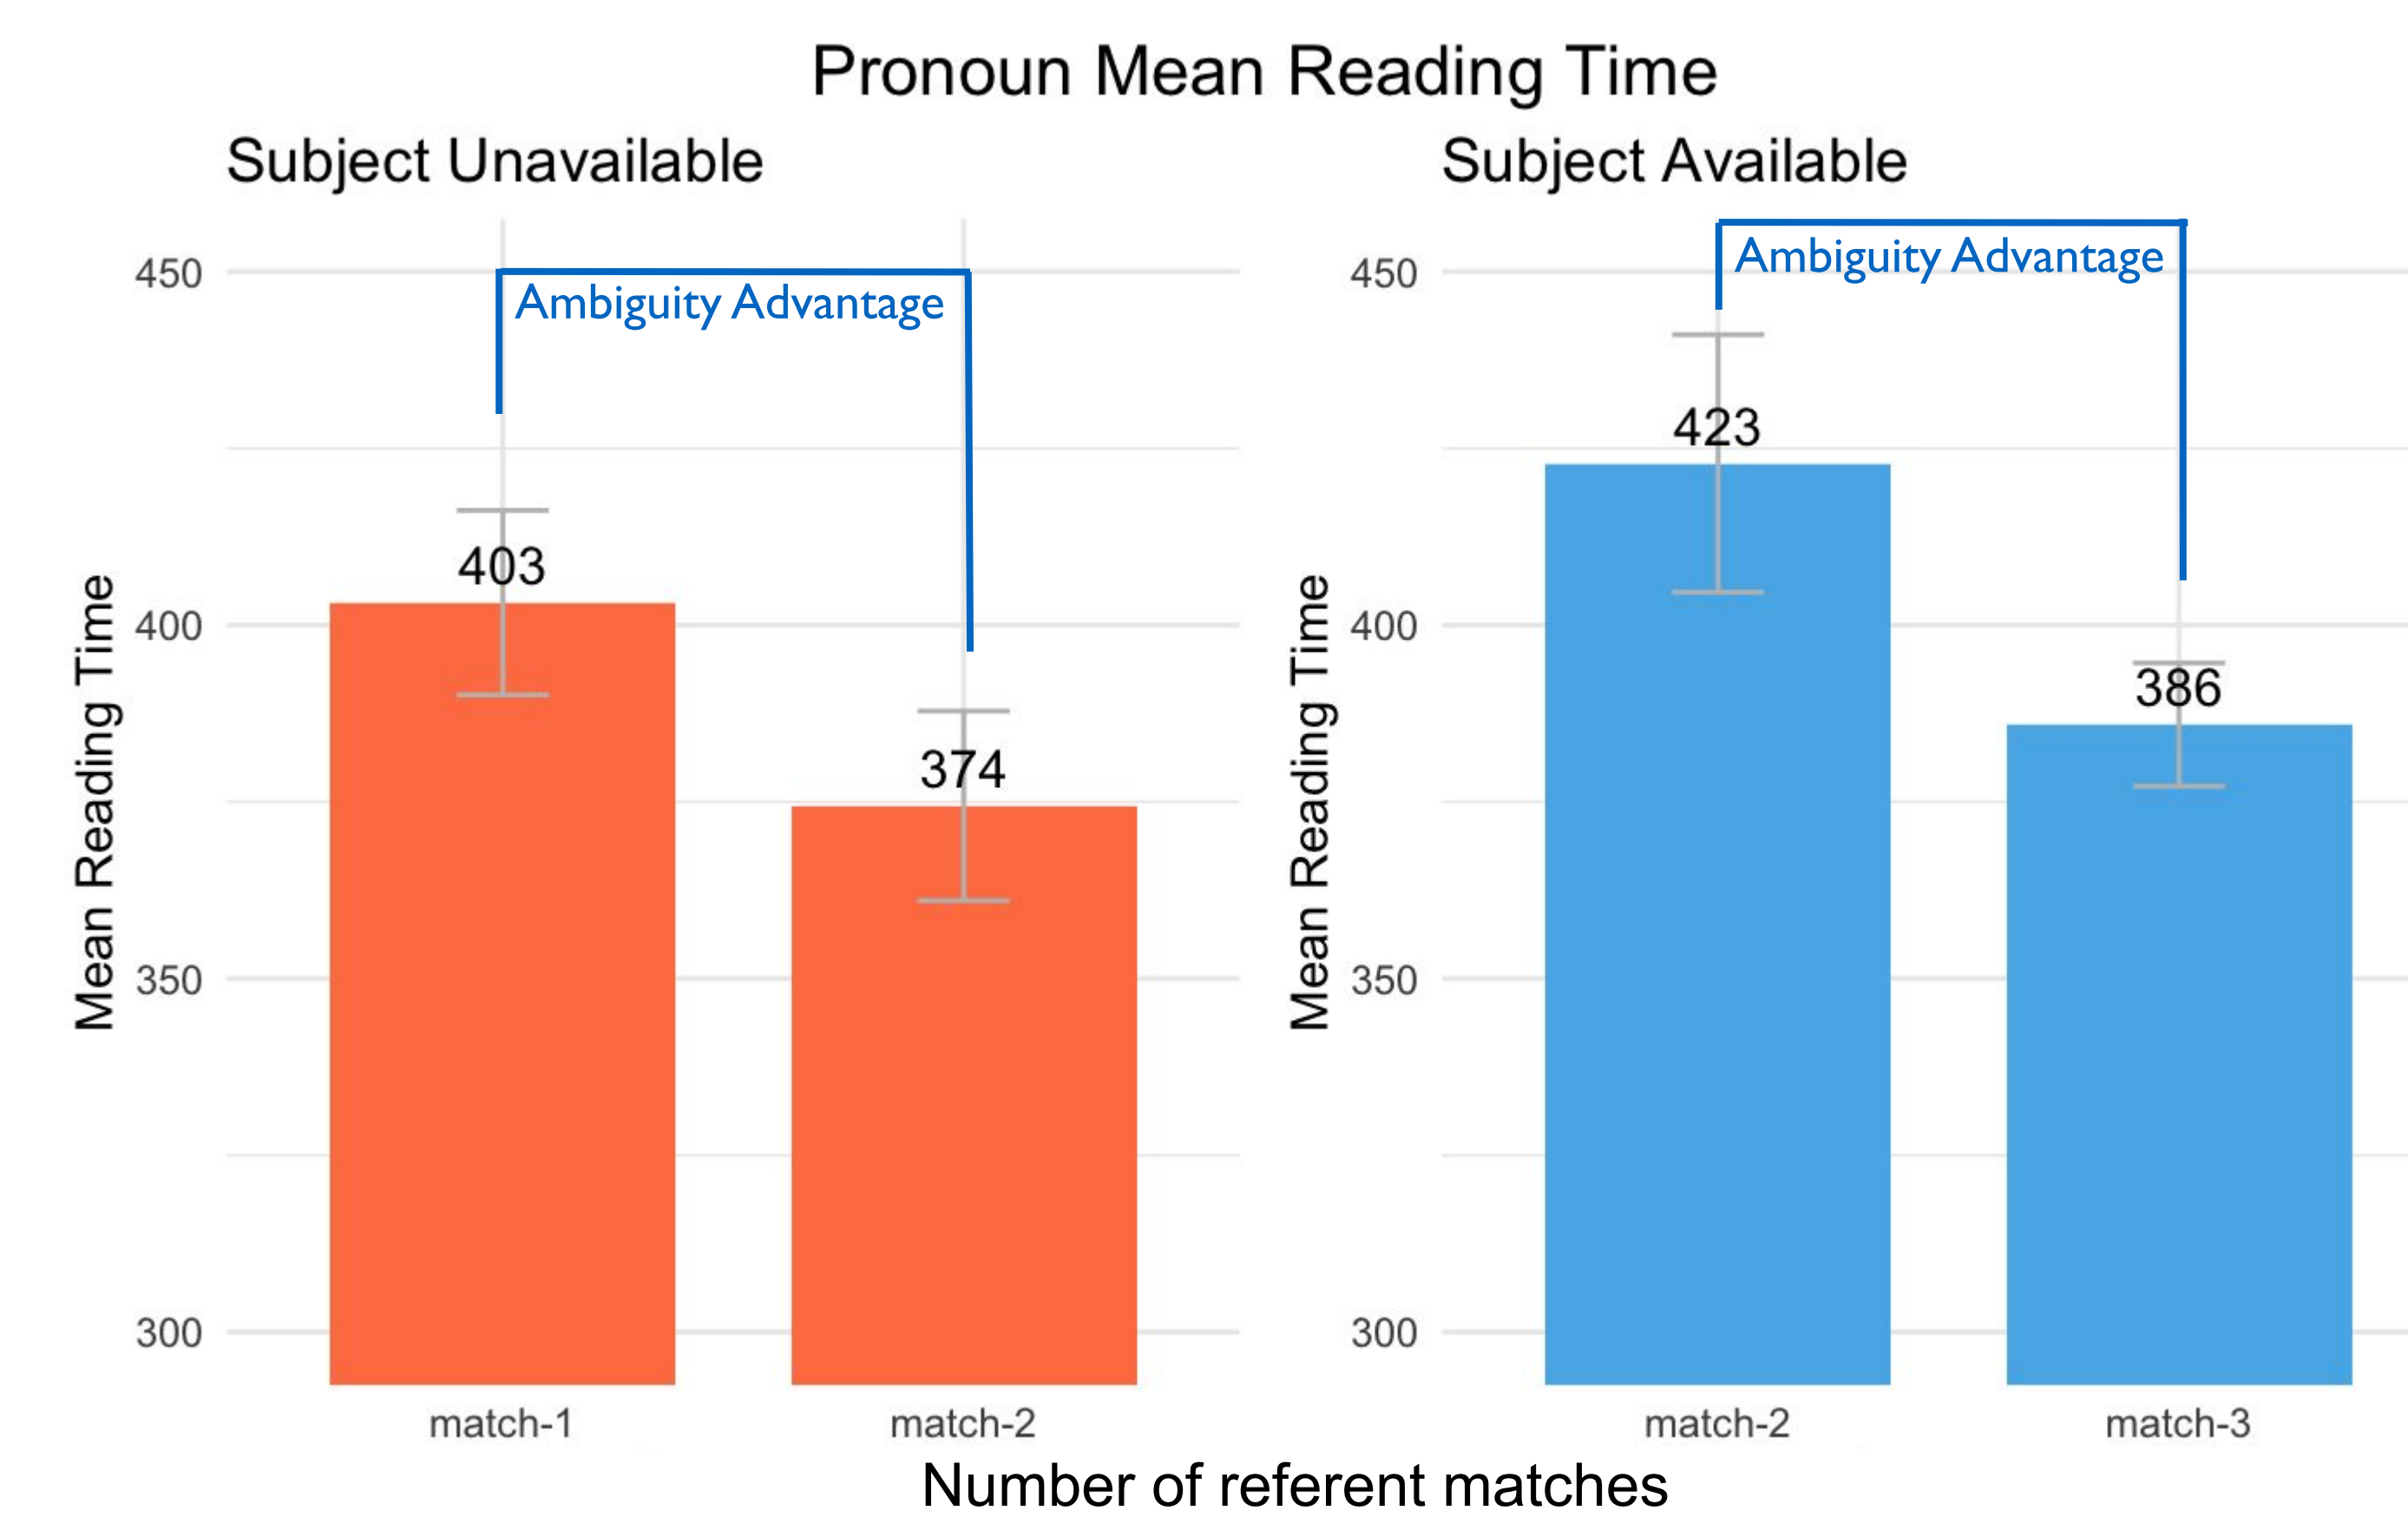

X Y X Y

Sentence: When Michael/Lisa arrived, William/Crystal mentioned to Gregory/Amy that the government would hire him in two weeks.

X Y X

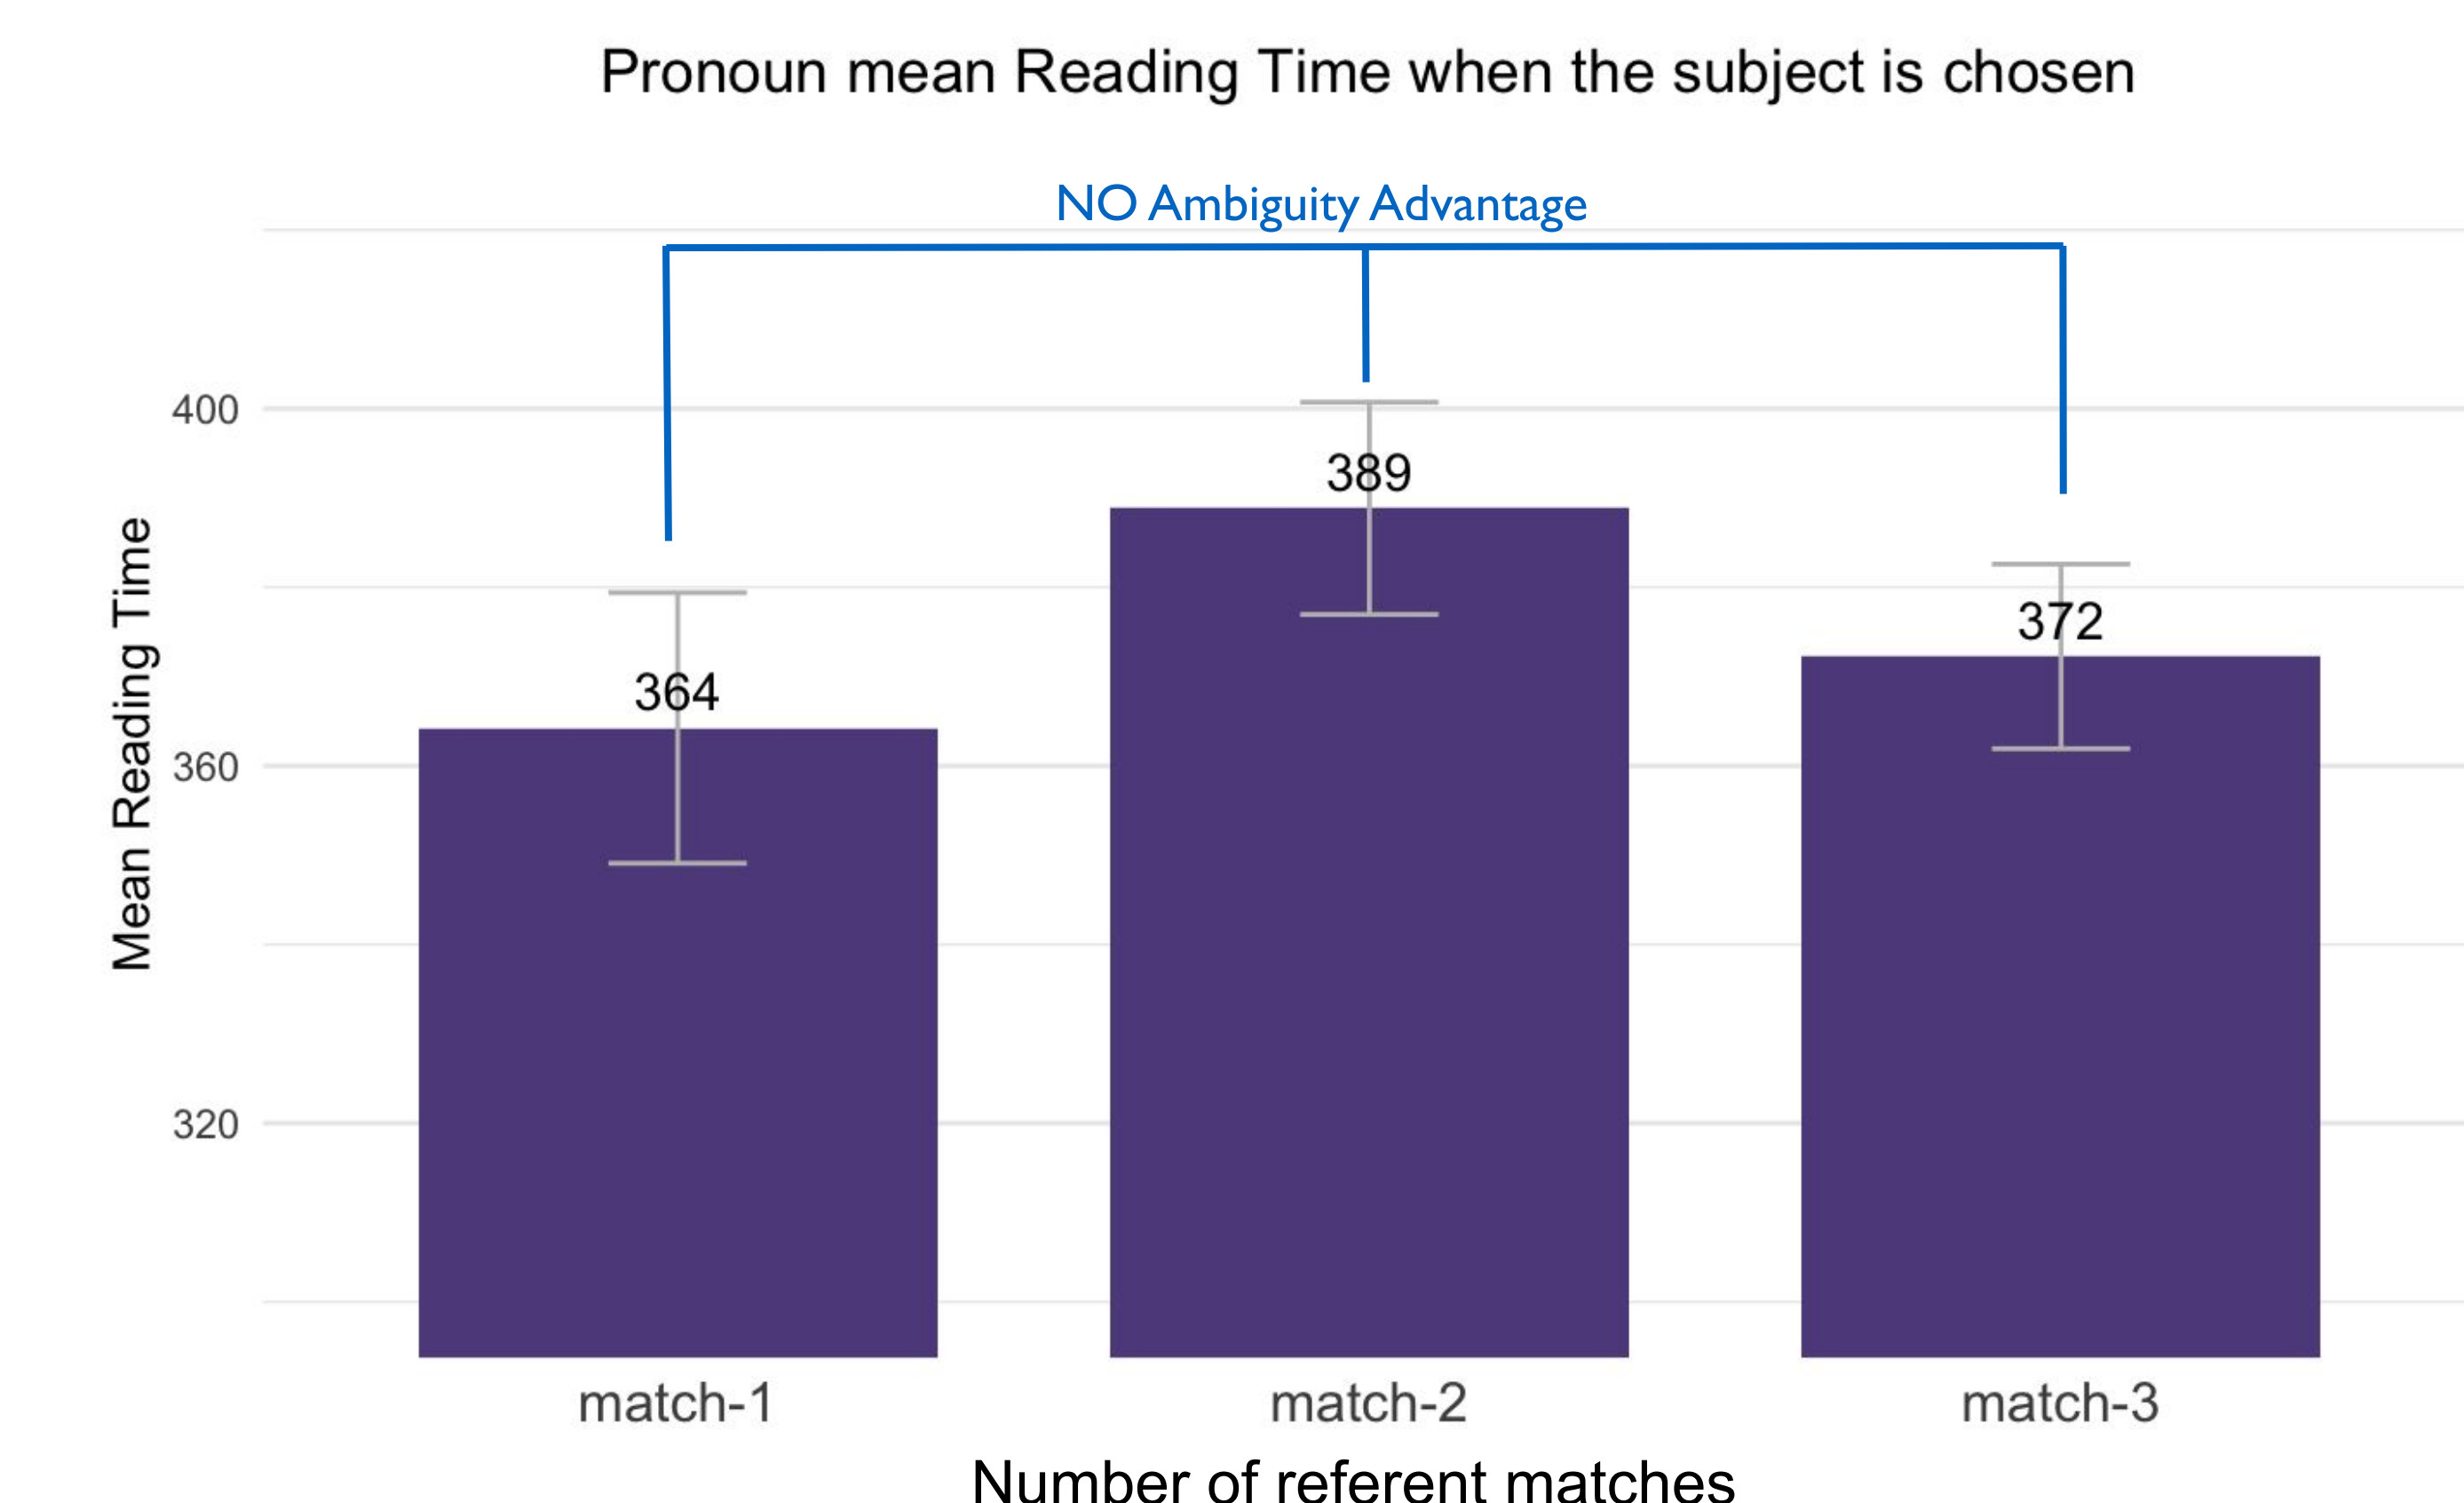

Question: Who would be hired by the government in two weeks?  
a. Michael/Lisa b. William/Crystal c. Gregory/Amy d. I'm not sure

- ✓ **Subject unavailable + not selected → Ambiguity Advantage**
- ✓ **Subject available + not selected → Ambiguity Advantage**

[p=0.06, .95CI=(-76.7ms, 2.8ms)] [p=0.03, .95CI=(-53.2ms, -2.6ms)]  
Effect of Ambiguity: RT at pronoun is faster when there is one more match antecedent.

### ✗ Subject available + selected → NO Ambiguity Advantage

Effect of Ambiguity: Number of matches is not a significant factor of RT (p>0.1)

- ❖ **Pronouns are numerically read faster when the subject is selected than when not selected for the comprehension response.**

### Interpretation responses Subject bias ✓

	Subject available			Subject unavailable			
	Match-3	Match-2	Match-1	Match-2	Match-1		
X = match Y = mismatch							
Selection %	XXX	XXY	YXX	YXY	XYX	YYX	XYY
Sub. subject	21	29	2	4	26.5	2.4	<b>82.7</b>
Matrix subject	<b>39</b>	<b>56</b>	<b>49</b>	<b>86</b>	10.2	5.4	8.8
Matrix object	24	3	38	4	<b>49.7</b>	<b>86.7</b>	3.1
I'm not sure	16	12	11	5	13.6	5.4	5.4

## 4. Discussion

State of the biased referent		Processing Effect
Available?	Chosen?	
-	-	Advantage
+	-	Advantage
+	+	No advantage

- ❖ We found that pronominal ambiguity resolution doesn't always show the ambiguity advantage effect.
  - It depends on whether the comprehenders select a preferred referent.
- ❖ If the comprehender doesn't select the biased referent, even when it is available, an ambiguity advantage effect occurs with multiple other match referents.
- ❖ **What could the underlying mechanism be?**
  - **One possibility:** The subject is represented in a **special state** in memory.
  - **Another possibility:** The subject has **stronger strength in activation** than other antecedents.

### Main findings

- ❖ Ambiguity advantage is conditioned by the selection of the biased referent.
- ❖ Comprehenders either represent the biased referent in a special cognitive state or as having stronger activation.
